Core Business Measures

Measure Name	DAX Formula	Description / Purpose
Total Sales	Total Sales = SUM(Sales_Fact[Correct_Sales])	Calculates the total revenue from all sales, based on the corrected sales amount.
Total Profit	Total Profit = SUM(Sales_Fact[Correct_Profit])	Calculates the total profit across all sales, based on the corrected profit values.
Profit Margin %	Profit Margin % = DIVIDE([Total Profit], [Total Sales])	Calculates profit as a percentage of total sales, to evaluate overall business profitability.
Total Orders	Total Orders = DISTINCTCOUNT(Sales_Fact[Order_ID])	Calculates the total number of unique orders placed, to track order volume.
Total Quantity	Total Quantity = SUM(Sales_Fact[Quantity])	Calculates the total quantity of items sold across all orders, to measure sales volume.
Avg Order Value	Avg Order Value = DIVIDE([Total Sales], [Total Orders])	Avg Order Value = DIVIDE([Total Sales], [Total Orders])
Avg Discount %	Avg Discount % = AVERAGE(Sales_Fact[Discount_Pct])	Calculates the average discount percentage across all sales, to analyze overall discount trends.
Discount Amount	Discount Amount = SUMX(Sales_Fact, Sales_Fact[Unit_Price] * Sales_Fact[Quantity] * Sales_Fact[Discount_Pct])	Calculates the total discount amount on all sales, based on unit price, quantity, and discount percentage.
Net Sales	Net Sales = [Total Sales] - [Discount Amount]	Calculates total sales revenue after discounts, representing actual revenue received.

Time Intelligence Measures

Measure Name	DAX Formula	Description / Purpose
Sales MTD	Sales MTD = TOTALMTD([Total Sales], Calendar[Date])	Calculates total sales month-to-date, using the Calendar table for current month context.
Sales YTD	Sales YTD = TOTALYTD([Total Sales], Calendar[Date])	Calculates total sales year-to-date, using the Calendar table for current year context.
Sales YoY Growth %	Sales YoY Growth % = DIVIDE([Total Sales] - [Sales LY], [Sales LY])	Calculates year-over-year growth percentage in sales, comparing current period to same period last year.
Profit YTD	Profit YTD = TOTALYTD([Total Profit], Calendar[Date])	Calculates total profit year-to-date, using the Calendar table for current year context.
Rolling 3M Sales	Rolling 3M Sales = CALCULATE([Total Sales], DATESINPERIOD(Calendar[Date], MAX(Calendar[Date]), -3, MONTH))	Calculates total sales over the last 3 months, using the Calendar table to define the rolling period.
Rolling 6M Profit	Rolling 6M Profit = CALCULATE([Total Profit], DATESINPERIOD(Calendar[Date], MAX(Calendar[Date]), -6, MONTH))	Calculates total profit over the last 6 months, using the Calendar table to define the rolling period.

Customer Measures

New Customers	New Customers = CALCULATE(DISTINCTCOUNT (Sales_Fact[Customer_ID]), FILTER(Sales_Fact, Sales_Fact[Order_Date] = Customers_Dim[First Purchase Date]))	Calculates the number of customers making their first purchase, to track new customer acquisition
Returning Customers	Returning Customers = CALCULATE(DISTINCTCOUNT(Sales_Fact[Customer_ID]), FILTER(Sales_Fact, Sales_Fact[Order_Date] > Customers_Dim[First Purchase Date]))	Calculates the number of customers making repeat purchases after their first purchase, to track returning customer behavior.
Repeat Purchase Rate %	Repeat Purchase Rate % = DIVIDE([Returning Customers], [New Customers])	Calculates the percentage of new customers who make a repeat purchase, to evaluate customer retention.
Avg Customer Spend	Avg Customer Spend = DIVIDE([Total Sales], DISTINCTCOUNT(Sales_Fact[Customer_ID]))	Calculates the average spending per customer, to evaluate typical customer purchase value.

Delivery / SLA Measures

Avg Delivery Days	Avg Delivery Days = AVERAGE(Sales_Fact[Delivery_Days])	Calculates the average number of days to deliver orders, to evaluate delivery performance.
Delayed Orders	Delayed Orders = CALCULATE(COUNT(Sales_Fact[Order_ID]), Sales_Fact[Delivery_Days] > 2)	Calculates the total number of orders delivered after 2 days, to monitor delivery delays.
SLA Compliance %	SLA Compliance % = DIVIDE([On Time Orders], [Total Orders])	Calculates the percentage of orders delivered on time, to track SLA compliance.

Returns Measures

Total Return Amount	Total Return Amount = CALCULATE(SUM(Sales_Fact[Correct_Sales]), Sales_Fact[Delivery_Status] = "Returned")	Calculates total sales amount of returned orders, to quantify revenue lost due to returns.
Return Rate %	Return Rate % = DIVIDE(COUNT(Returns_Fact[Return_ID]), [Total Orders])	Calculates the percentage of orders returned, to monitor product return trends.
Top Return Reason	Top Return Reason = TOPN(1, VALUES(Returns_Fact[Return_Reason]), CALCULATE(COUNT(Returns_Fact[Return_ID])), DESC)	Identifies the most common reason for product returns, to analyze and address return causes.
Profit Loss Due to Returns	Profit Loss Due to Returns = CALCULATE(SUM(Sales_Fact[Correct_Profit]), Sales_Fact[Delivery_Status] = "Returned")	Calculates total profit lost due to returned orders, to quantify financial impact of returns

Inventory Measures

Stock Available	Stock Available = SUM(Inventory_Fact[Stock_Qty])	Calculates total stock available across all products, to monitor inventory levels.
Low Stock Products	Low Stock Products = CALCULATE(COUNT(Inventory_Fact[Product_ID]), Inventory_Fact[Stock_Qty] < Inventory_Fact[Reorder_Level])	Calculates the number of products with stock below reorder level, to identify low-stock items.
Restock Needed	Restock Needed = IF(SUM(Inventory_Fact[Stock_Qty]) < SUM(Inventory_Fact[Reorder_Level]), "YES", "NO")	Determines if products need restocking by comparing stock with reorder level, returning 'YES' or 'NO'.
Avg Supplier Lead Time	Avg Supplier Lead Time = AVERAGEX(Inventory_Fact, DATEDIFF(Inventory_Fact[last_restock_date], TODAY(), DAY))	Calculates the average number of days since each product was last restocked.

Calculated Columns

Order Month	Order Month = MONTH(Sales_Fact[Order_Date])	Extracts numeric month from order date for monthly trend analysis and sorting.
Order Year	Order Year = YEAR(Sales_Fact[Order_Date])	Extracts the year from order date for year-wise trend analysis.
Age Group	Age Group = SWITCH(TRUE(), Customers_Dim[Age] <= 25, "18-25", Customers_Dim[Age] <= 35, "26-35", Customers_Dim[Age] <= 50, "36-50", "50+")	Categorizes customers into age groups for demographic analysis and targeted marketing.
Profit Bucket	Profit Bucket = SWITCH(TRUE(), Sales_Fact[Correct_Profit] < 0, "Loss", Sales_Fact[Correct_Profit] <= 500, "Low", "High")	Categorizes sales into Loss, Low, or High based on profit to analyze transaction profitability.
Delivery Performance Category	Delivery Performance Category = SWITCH(TRUE(), Sales_Fact[Delivery_Days] <= 1, "Fast", Sales_Fact[Delivery_Days] <= 2, "Normal", "Delayed")	Categorizes deliveries as Fast, Normal, or Delayed to monitor delivery performance.
Customer Tenure	Customer Tenure = DATEDIFF([First Purchase Date], TODAY(), DAY)	Calculates days since customer's first purchase to evaluate loyalty and tenure.
